Abstract

At the crossroads of current innovation policies towards a European Research Area (ERA) and a European Higher Education Area (EHEA) lies an important province of higher learning and research: doctoral training and the further careers of PhD graduates. A considerable number of higher education systems across Europe shift their paradigms for doctoral training away from the traditional so-called Humboldtian model towards the so-called professional model. On this background, the paper discusses (1) the German pattern of a strong link of the PhD to the labor market outside academe that is based on a traditional academic-disciplinary mode of apprenticeship training, and (2) approaches that argue for a new mode of knowledge production replacing an academic-disciplinary model of research training by a hybrid model that crosses disciplinary and organizational borders. The paper argues that a diversity of organisational and structural forms as well as different validation criteria and procedures will probably determine the future face of research training.
