Abstract

This research using a time survival model is aimed at analysing which factors determine the time it took Spanish university graduates to find their first job during the 2009â€“15 period, a time framework where the Spanish economy underwent the worst effects of the financial crisis. As far as training is concerned, both the type of degree (bachelor or master) and the field of knowledge decisively influence the employability process. Other factors also contribute to significantly reduce the time to obtain the first job. Among these are studying at a private university, taking a university masterâ€™s degree and studying abroad, as well as speaking some languages and having been awarded any grant. Gender does not seem to exercise any influence. (HRK / Abstract übernommen)
