Abstract

This study provides a profile of the actions taken by Australian universities to diversify their revenue streams in order to generate more independent (non-government) income. Marginson's taxonomy of Australian universities is used to categorise universities and contrast levels of independent income (Marginson and Considine 2000). This study finds that some Australian universities have used isomorphic tactics in their attempts to diversify their revenue streams. Unitechs (Universities of Technology) and New Universities are over-reliant upon income earned from overseas student fees, whilst earning comparatively small amounts of revenue from Royalties, Trademarks and Licences, Consultancy, Contract Research and Investments. This work discusses the dangers inherent in over-reliance on a single type of independent income. It argues that if Australian universities seek to enhance their success competing in global research, staff and student markets then they need to augment efforts to diversify revenue streams with structural and cultural changes, transforming
